Table XXVIII	Whooping Cough		43-44
Table XXIX	Reported cases, for the state, of the reportable diseases, by age, for 1947....	Page	45
Table XXX	Reported cases, for the state, of the reportable diseases, by color and sex, for 1947, with case rate per 100,000 population.....	Page	46

INTRODUCTION

The sixteenth bulletin of North Carolina morbidity statistics, covering the calendar year 1947, contains the same tabulations of the thirty-five reportable diseases as are contained in the previous bulletins.

There are three diseases which have shown some increase during the past few years: granuloma inguinale, Rocky Mountain spotted fever, and tularemia. Granuloma inguinale, which was not made reportable until 1945, has shown a slight increase in reported incidence each year since that date. Rocky Mountain spotted fever has made a small increase each year except one since 1941. The rate at that time was 0.6 cases per 100,000 population and is now 2.4. The tularemia rate in 1944 was 0.3 and has increased to 2.0 in 1947.

In addition to the above, chancroid has shown increases for the past two years, reaching 14.3 cases per 100,000 population in 1947 as compared to 11.8 in 1945. The highest chancroid rate in the past ten years was 18.4 in 1943. Tuberculosis has shown an increase in reported cases for the past three years, probably largely due to improved case finding. The 1947 morbidity rate of 96.6 together with the mortality rate for the same year of 28.4 represents the most favorable ratio of cases per death in North Carolina for many years. There has been an increase in the percentage of reported minimal active tuberculosis cases from 14.7 in 1945 to 16 in 1947. Undulant fever increased from 9 cases in 1946 to 21 cases in 1947.

In 1947, poliomyelitis cases reached the third largest number ever reported. The majority of the cases were confined to three south central counties in the state and occurred relatively late in the season.

Gonorrhea and syphilis remain the largest single causes of morbidity among the reportable communicable diseases; however, encouraging declines occurred in 1947. The gonorrhea morbidity rate has been rising steadily in this state as reporting and case finding have improved. Ten years ago the reported gonorrhea morbidity rate was 82 cases per 100,000 population. This rate increased steadily to 421 in 1946. This past year shows the first sizeable decline that has taken place during this period with a rate of 381. Syphilis morbidity reports rose steadily for many years until 1939 when a peak of 877 cases per 100,000 population was reported. Following that year, syphilis morbidity declined annually until 1946 when the rate again rose to 242. In 1947 the rate declined to 235. Whether or not this decline represents a renewal of the downward trend in syphilis morbidity, interrupted by demobilization, remains to be seen.

Diphtheria morbidity rose slightly over the record low established in 1946; however, pertussis morbidity was the lowest recorded since 1936. Typhoid fever cases reached a record low of 47 cases, having declined without interruption since 1935.

An interesting decline has taken place in scarlet fever morbidity during the past two years. Prior to 1945 the rate fluctuated between 60 and 80 cases per 100,000 population over a period of at least ten years without any tendency to decline. In 1946 the rate dropped to 40, the lowest ever recorded. In 1947 the rate dropped still further to 31.

The hazard of war-born malaria and amebic dysentery appears to be steadily diminishing. While reports of malaria in veterans are being received, the over-all recorded malaria morbidity rate declined from 9.6 cases per 100,000 last year to 3.7 in 1947. The rate for amebic dysentery remained unchanged at 0.5 cases per 100,000 population.

Murine typhus fever declined to 1.4 cases per 100,000 population, making the fourth consecutive year of decline. This is the lowest rate recorded for this disease since 1934. Meningococcus meningitis declined to the lowest point since 1942, having decreased each year since 1943. The rate in that year was 13.2, the highest recorded in many years, and may have been a result of large population movements during the war. The 1947 rate is 2.6.
